

High efficiency, improved safety and
excellent pricing in commercial,
distributed inverter solutions

Utility

Lower your BOS cost:

With string inverters no additional combiner boxes or re-combiner boxes need to be purchased and installed.

Ease of service:

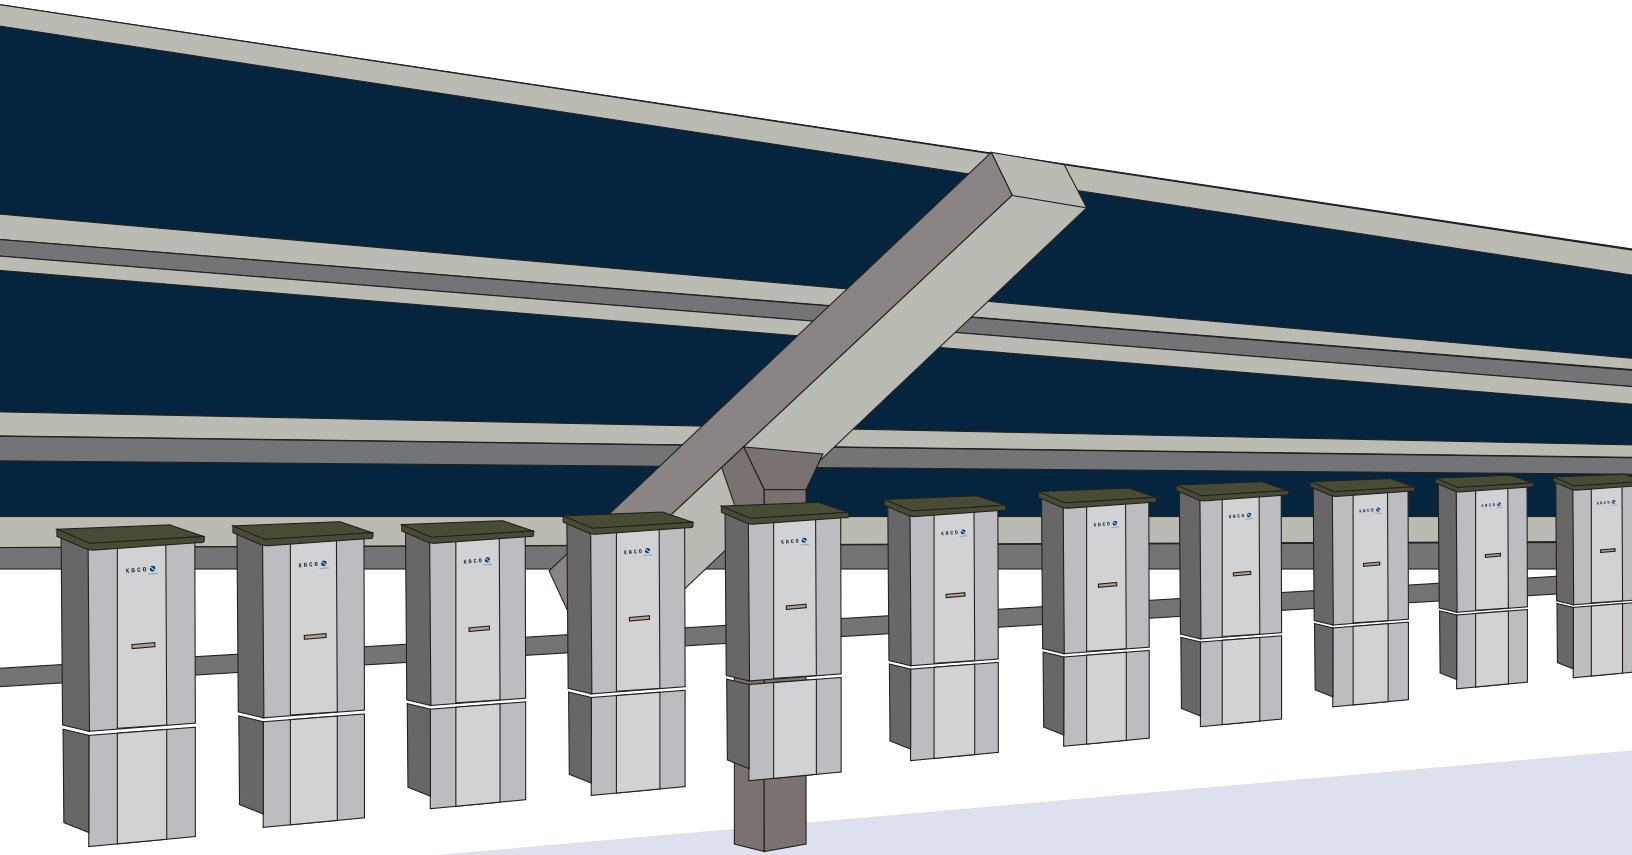

Replacing a string inverter is much easier and faster than repairing a central inverter and doesn't require specially trained personnel.

No inverter maintenance necessary:

Central inverters require annual maintenance and inspection. String inverters don't!

Increased warranty:

10 year standard vs. 5 year standard (central inverter). KACO is one of the few inverter companies older than the warranty.

Increase your energy yield:

Multiple MPP trackers increase energy yield or decrease energy losses due to soiling, failed modules, etc.

High resolution monitoring:

Distributed inverter monitoring does not require expensive string monitoring combiner boxes.

Redundancy / Reliability:

In the rare event of an inverter failure, only a small fraction of the system is affected.

Higher ROI:

Increase your energy yield, reduce your downtime and extend your standard warranty period.
